| **This European Technical Assessment contains** | 16 pages including 13 Annexes which form an integral part of this assessment. |
| **This European Technical Assessment is issued in accordance with regulation (EU) No 305/2011, on the basis of** | EAD 330087-00-0601 |
| **This version replaces** | ETA 13/0661 issued on 07/06/2013 |

Translations of this European Technical Assessment in other languages shall fully correspond to the original issued document and should be identified as such.

Communication of this European Technical Assessment, including transmission by electronic means, shall be in full (excepted the confidential Annex(es) referred to above). However, partial reproduction may be made, with the written consent of the issuing Technical Assessment Body - Technical and Test Institute for Construction Prague. Any partial reproduction has to be identified as such.
1. **Technical description of the product**

The ING MP+ and ING MP+ Tropical (extended curing time) injection system is used for the connection, by anchoring or overlap joint, of reinforcing bars (rebars) in existing structures made of normal weight concrete. The design of the post-installed rebar connections is done in accordance with the regulations for reinforced concrete constructions.

Reinforcing bars made of steel with a diameter d from 8 to 25 mm and ING MP+, ING MP+ Tropical chemical mortar are used for rebar connections. The steel element is placed into a drilled hole filled with injection mortar and is anchored via the bond between embedded element, injection mortar and concrete.

The illustration and the description of the product are given in Annex A.

2. **Specification of the intended use in accordance with the applicable EAD**

The performances given in Section 3 are only valid if the anchor is used in compliance with the specifications and conditions given in Annex B.

The provisions made in this European Technical Assessment are based on an assumed working life of the anchor of 50 years. The indications given on the working life cannot be interpreted as a guarantee given by the producer, but are to be regarded only as a means for choosing the products in relation to the expected economically reasonable working life of the works.

3. **Performance of the product and references to the methods used for its assessment**

3.1 **Mechanical resistance and stability (BWR 1)**

3.3 **General aspects relating to fitness for use**

Durability and serviceability are only ensured if the specifications of intended use according to Annex B 1 are kept.

4. **Assessment and verification of constancy of performance (AVCP) system applied with reference to its legal base**

According to the Decision 96/582/EC of the European Commission the system of assessment verification of constancy of performance (see Annex V to Regulation (EU) No 305/2011) given in the following table apply.

5. **Technical details necessary for the implementation of the AVCP system, as provided in the applicable EAD**

5.1 **Tasks of the manufacturer**

The manufacturer may only use raw materials stated in the technical documentation of this European Technical Assessment.

The factory production control shall be in accordance with the control plan which is a part of the technical documentation of this European Technical Assessment. The control plan is laid down in the context of the factory production control system operated by the manufacturer and deposited at Technical and Test Institute for Construction Prague.²

The results of factory production control shall be recorded and evaluated in accordance with the provisions of the control plan.

5.2 **Tasks of the notified bodies**

The notified body shall retain the essential points of its actions referred to above and state the results obtained and conclusions drawn in a written report.

The notified certification body involved by the manufacturer shall issue a certificate of constancy of performance of the product stating the conformity with the provisions of this European Technical Assessment.

In cases where the provisions of the European Technical Assessment and its control plan are no longer fulfilled the notified body shall withdraw the certificate of constancy of performance and inform Technical and Test Institute for Construction Prague without delay.

Issued in Prague on 29.08.2018

By

Ing. Mária Schaan
Head of the Technical Assessment Body

---

² The control plan is a confidential part of the documentation of the European Technical Assessment, but not published together with the ETA and only handed over to the approved body involved in the procedure of AVCP.

Specifications of intended use

Anchorages subject to:
- Static and quasi-static load.

Base materials
- Reinforced or unreinforced normal weight concrete according to EN 206:2013
- Strength classes C12/15 to C50/60 according to EN 206:2013.
- Maximum chloride concrete of 0,40% (CL 0.40) related to the cement content according to EN 206:2013.
- Non-carbonated concrete.
  Note: In case of a carbonated surface of the existing concrete structure the carbonated layer shall be removed in the area of the post installed rebar connection (with a diameter $d_s + 60$ mm) prior to the installation of the new rebar. The depth of concrete to be removed shall correspond to at least minimum concrete cover in accordance with EN 1992-1-1.
  The foregoing may be neglected if building components are new and not carbonated.

Temperature range:
- -40°C to +80°C (max. short. term temperature +80°C and max. long term temperature +50°C)

Use conditions (Environmental conditions)
- The rebars may be used in dry or wet concrete.

Design:
- The anchorages are designed under the responsibility of an engineer experienced in anchorages and concrete work.
- Verifiable calculation notes and drawings are prepared taking account of the forces to be transmitted.
- The position of the reinforcement in the existing structure shall be determined on the basis of the construction documentation and taken into account when designing.

Installation:
- Dry or wet concrete.
- It must not be installed in flooded holes.
- Hole drilling by hammer drill or compressed air drill mode.
- The installation of post-installed rebars shall be done only by suitable trained installer and under supervision on site. The conditions under which an installer may be considered as suitable trained and the conditions for supervision on site are up to the Member States in which the installation is done.
- Check the position of the existing rebars (if the position is not known, it shall be determined using a rebar detector suitable for this purpose)
Figure B1: General design rules of construction for bonded-in rebars

- Only tension forces in the axis of the rebar may be transmitted
- The transfer of shear forces between new concrete and existing structure shall be designed additionally according to EN 1992-1-1.
- The joints for concreting must be roughened to at least such an extent that aggregate protrude.

\[ c \geq \min c \]

1) If the clear distance between lapped bars exceeds \( 4d_s \) then the lap length shall be increased by the difference between the clear bar distance and \( 4d_s \)

Figure B2: Example of drilling aid

Minimum anchorage length $\ell_{b,\text{PIR}}$ and minimum anchorage lap length $\ell_{0,\text{PIR}}$

Minimum anchorage length

$\ell_{b,\text{PIR}} = \alpha_{ib} \cdot \ell_{b,\text{min}}$

$\alpha_{ib}$ = amplification factor for minimum anchorage length (see Annex C 1, Table C2)

$\ell_{b,\text{min}}$ = minimum anchorage length of cast-in rebar according to EN 1992-1-1, eq. 8.6

Minimum lap length

$\ell_{0,\text{PIR}} = \alpha_{ib} \cdot \ell_{0,\text{min}}$

$\alpha_{ib}$ = amplification factor for minimum anchorage length (see Annex C 1, Table C2)

$\ell_{0,\text{min}}$ = minimum lap length of cast-in rebar according to EN 1992-1-1, eq. 8.11

Table B2: Drilling diameter and maximum embedment depth

Annex B 6
Drilling the hole

Drill hole to the required embedment depth using a hammer-drill with carbide drill bit set in rotation hammer mode, or a compressed air drill.

Rotary hammer drilling
Compressed air drill

Before drilling remove carbonized concrete.
In case of aborted drill hole the drill hole shall be filled with mortar.

- Observe concrete coverage $c$, as per setting plan and Table B1
- Drill parallel to the edge and to existing rebar

Cleaning the hole

The borehole must be free of dust, debris, water, ice, oil, grease and other contaminants prior to mortar injection.

- Blowing 2 time from the back of the hole with oil-free compressed air (min. 6 bar) until return air stream is free of noticed dust.
- Brushing 2 time with the special brush size (brush $\Omega \geq$ borehole $\varnothing$) by inserting the brush to the back of the hole in a twisting motion. The brush shall produce natural resistance as it enters the anchor hole. If this is not the case, please use a new brush or a brush with a larger diameter.
- Repeat operation 1 and 2.
- Blowing 1 time again with compressed air until return air stream is free of noticeable dust.
**Mortar injection**

If the hole collects water after initial cleaning, this water must be removed before injecting the resin.

Before use, make sure the rebar is dry and free of oil or other residue.

Mark embedment depth on the rebar (e.g. with tape) $\ell_v$

Insert rebar in borehole, to verify hole and setting depth $\ell_v$

- Check expiration date: See imprint on cartridge. Do not use an expired product
- Foil pack temperature: Must be between +5°C and +40°C when in use
- Base material temperature at time of installation: Must be between +5°C and +40°C
- Instructions for transport and storage: Keep in a cool, dry and dark place at +5°C to +20°C achieve maximum shelf life

Select the appropriate static mixer nozzle for the installation, open the cartridge/foil and screw onto the mouth of the cartridge. Insert the cartridge into the correct applicator gun.

Extrude the first part of the cartridge to waste until an even colour has been achieved without streaking in the resin

If necessary, cut the extension tube to the depth of the hole and push onto the end of the mixer nozzle, and (for rebars 16 mm dia. or more) fit the correct resin stopper to the other end. Attach extension tubing and resin stopper.

Insert the mixer nozzle (resin stopper / extension tube if applicable) to the bottom of the hole. Begin to extrude the resin and slowly withdraw the mixer nozzle from the hole ensuring that there are no air voids as the mixer nozzle is withdrawn. Fill the hole to approximately $\frac{1}{2}$ to $\frac{3}{4}$ full and remove the mixer nozzle completely.
Inserting the rebar

Mark the required mortar level $\ell_m$ and embedment depth $\ell_v$ with tape or marker on the injection extension.

Quick estimation: $\ell_m = 1/2 \cdot \ell_v$

Continue injection until the mortar level mark $\ell_m$ becomes visible.

Insert the rebar, free from oil or other release agents, to the bottom of the hole using a back and forth twisting motion ensuring all the threads are thoroughly coated. Adjust to the correct position within the stated working time.

Any excess resin should be expelled from the hole evenly around the steel element showing that the hole is full. This excess resin should be removed from around the mouth of the hole before it sets.

Leave the anchor to cure. Do not disturb the anchor until the appropriate loading/curing time has elapsed depending on the substrate conditions and ambient temperature.
Design bond strength of post-installed rebar $f_{bd,PIR}$

$$f_{bd,PIR} = k_b \cdot f_{bd}$$

$k_b$ = reduction factor

$f_{bd}$ = design bond strength of cast-in rebar according to EN 1992-1-1

**Table C1:** Values of the design bond strength of post installed rebar $f_{bd,PIR}$ for all drilling methods for good bond conditions
